## Notes

The results of the national accounts for the years 2006 to 2011 are mainly based on the data from spring 2012.

## Abbreviations and symbols

- . Data unknown, not to be published or not meaningful
- 0 Less than 0.5 but more than nil
- Nil

Discrepancies in the totals are due to rounding.

## Methodological notes

### Preliminary remark

This publication contains the results of the financial accounts of the Deutsche Bundesbank for the period from 2006 to 2011. The following notes provide an overview of the subject matter and methodology of these accounts, helping to create a better understanding of these results.

### Content, objective and purpose of the financial accounts

#### National accounts

*Reflecting complexity*

In modern, specialised economies, the production process is characterised by countless interactions between economic agents and is therefore extremely complex. The statistical recording of these interactions is essential for various purposes, including empirical analysis and the provision of information for economic policy decisions. Such data must be recorded systematically and consistently to ensure historical and geographic comparability. The geography, subject matter and time of an economic interest can be collated and made available as macroeconomic data by aggregating economic entities into sectors, transactions into accounts and instruments, and dynamics into temporal periods. This is the purpose of the national accounts, which systematically record and describe the economic activities of a national economy in the form of standardised accounts.

*Financial accounts as part of the national accounts*

A complex economy consists of the production, distribution and utilisation of goods (real economy) and the corresponding financial activities and intermediation (financial economy). The traditional (real economic) part of the national accounts reflects the goods and services produced during a specific period as well as the associated income. By contrast, the financial accounts – an integral part of the national accounts – reflect financial activities. The results of the financial accounts show to whom, on what scale and in which form financial resources were made available or taken up in an economy, and which financial intermediaries were involved in the financing cycle.

*Financing ...*

Financing (financial activity) is essentially understood to be the provision of funds for the purpose of financial (intermediate financing) or real economic activity (consumption or investment). In the case of external financing, external

funds are raised for this purpose, while for internal financing, own funds are used (eg profit).

The acquisition of assets (or assets themselves) is the counterpart of financing. It essentially comprises financial and non-financial assets, whereby non-financial assets consist primarily of real estate and financial assets of financial lending and money creation. From a global perspective, the source of financial assets is therefore always external financing, which ultimately leads to utilisation in consumption and investment. The real economy and financial economy are therefore closely linked.

*... and acquisition of assets*

The starting point for the compilation of the financial accounts is data regarding the acquisition of non-financial assets and the savings of the individual sectors, which are based on the corresponding real economic figures from the national accounts. The balances resulting from the acquisition of non-financial assets on the one hand, and from saving plus capital transfers on the other, show to what extent a sector was a lender to or borrower from other sectors (net borrowing/lending) (see chart on page 6). These net lending or net borrowing aggregates normally correspond to the balances arising from the acquisition of financial assets and external financing of the individual sectors, the calculation of which lies at the heart of the financial accounts. The financial accounts therefore provide an impression of the basic structure of the financial system (ie the domestic channels through which financial assets are acquired and financial resources are obtained) as well as of the financial behaviour of households, enterprises and general government.

*Linkage of financial accounts and national accounts*

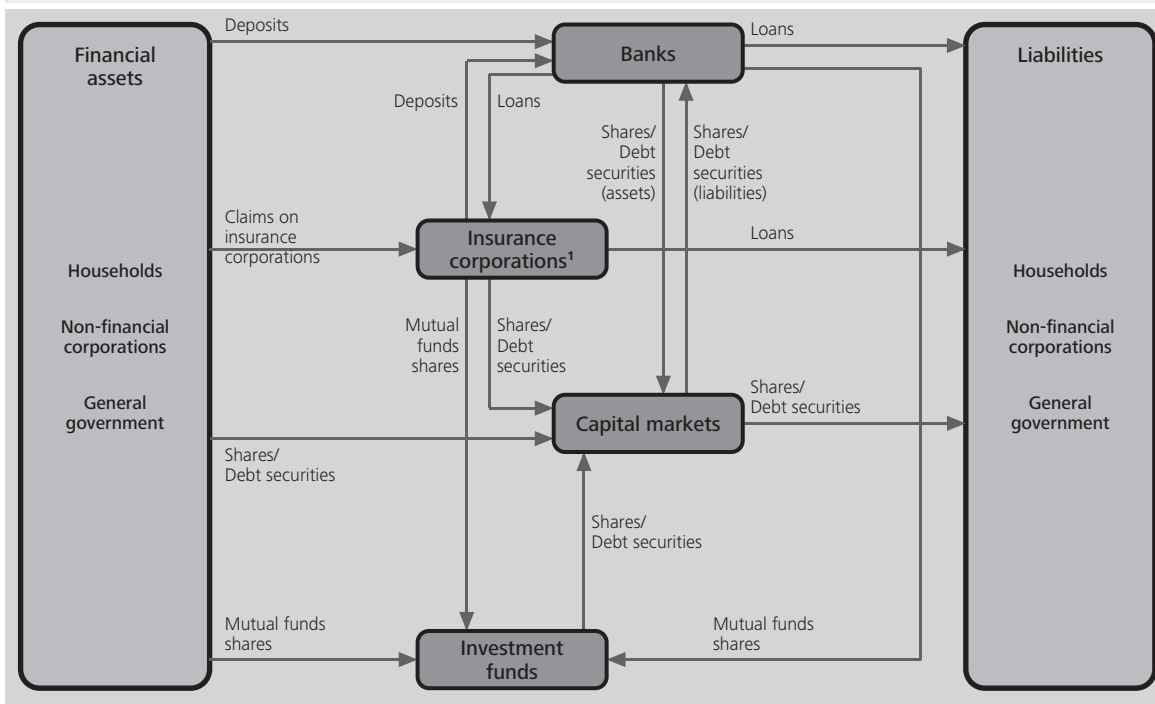

The financial accounts capture aggregate financial transactions during the period under review (in the financial flows account). Additionally, they record the amount of financial assets and liabilities as of a given date (in the financial balance sheets), thereby contributing significantly to the compilation of sectoral and aggregate balance sheets. This information is necessary for, among other things, analytical purposes in that economic behaviour may be influenced by the level and structure of financial (and non-financial) assets and liabilities.

*Financial balance sheets*

The Bundesbank itself uses the results of the financial accounts to, among other things, study the portfolio structure of non-banks within the context of monetary analysis. Moreover, knowledge of the financing structure and dynamics of non-banks as well as of the respective determinants are helpful with regard to monetary trans-

Deutsche Bundesbank

mission. The Bundesbank's interest is mainly focused on the relationship between the credit operations of domestic banks on the one hand and on the other sources of funding (such as securities markets, other financial intermediaries, insurance corporations and foreign lenders) on the other. Its aim is, *inter alia*, to uncover the links between the credit and securities markets. In this context, it also examines questions concerning the development and sustainability of (sectoral) debt. The Bundesbank – in addition to its business cycle analysis – looks at the pattern of asset acquisition and financing of enterprises and households, also in connection with real economic variables of the national accounts (especially capital formation and saving).

input-output accounts, and includes the definitions and characteristics of transactions, economic entities etc that are needed to prepare the standardised EU national and financial accounts. The ESA allows financial and real economic flows to be reported in their entirety and used for analytical purposes.

**Publications**

The Bundesbank began to develop national financial accounts data very early on. The first publication appeared in 1955.<sup>5</sup> Since then, financial transactions data have been commented on regularly in the Bundesbank's Monthly Reports and in other publications. In the course of further

*Evolution of the financial accounts in Germany*

*Statistical systems: SNA and ESA*

The United Nations created the System of National Accounts (SNA)<sup>1</sup> to create uniformity and standardisation at international level. Within the European Union (EU), a more detailed version with specific definitions is required to manage and monitor economic and monetary union. The European System of Accounts (ESA)<sup>2</sup> satisfies this requirement and provides a standardised methodical framework<sup>3</sup> that is prescribed to all EU member states by directive.<sup>4</sup> It essentially contains the integrated components of domestic output, distributive and capital transactions and

developing the original statistics, stock data on financial assets and liabilities of the individual sectors were published for the first time in 1971. Since then, financial balance sheets have been part of the standard publication programme.<sup>6</sup> The complete annual financial accounts appear at regular intervals as a separate Special Statistical Publication. Since the beginning of 2007, the current quarterly data for the sectors households and non-financial corporations have been published in the statistical section of the Monthly Report. Additionally, the corresponding data for these and other sectors can be found in the time-series database on the Bundesbank's website.<sup>7</sup>

*Results based on ESA 95*

This publication shows the annual results of the financial accounts for the period 2006 to 2011. The data on financial flows and stocks have been compiled according to the current version of the ESA from 1995 (ESA 95).

## ■ Methodological structure

### Basic principles

*Financial assets and external financing*

The financial accounts form a closed-loop system. Consequently, total assets equal total liabilities. Transactions are divided into acquisition of financial assets and external financing, and stocks into financial assets and liabilities. The terms "acquisition of financial assets" and "external financing", and "financial assets" and "liabilities" are defined broadly. Financial assets are classified as any asset that pertains to a creditor-debtor relationship, whereby the creditor has a legally enforceable claim on the debtor. Besides direct creditor-debtor relationships, they include financial operations in the form of shares and other equity, claims on insurance corporations, the rest of the world and "financial gold" holdings (this position in the financial accounts results from currencies formerly being backed by gold through fixed pegging against the US dollar until the end of the Bretton Woods system; gold holdings of other sectors are classified as non-financial assets). Internal financing encompasses, for example, the retention of profits by enterprises and tax levies by general government.

### Sectoral breakdown

*Residence concept and classification by sector (S)*

The financial accounts show the financial relationships between all economic entities permanently domiciled in Germany (residence concept). Foreign employees and the production sites of foreigners in Germany are thus treated as domestic economic entities (sector S.1), whereas German facilities domiciled abroad are regarded as non-residents and are thus assigned to the sector Rest of the

world (sector S.2). Domestic entities are grouped in institutional sectors according to their economic and financial nature (see Overview of sectors on page 8). Thereby, an unequivocal classification into the main and sub-sectors of the national accounts is not always possible, as economic entities may engage in multiple activities. Classification is consequently based on their primary function or their primary behaviour. The system of sectoral classification used in the German financial accounts differs in some respects from that used in ESA 95 owing to the special focus of the financial accounts on the financial flows. Whereas ESA 95 defines the sector Financial corporations and divides it into various sub-sectors, the German financial accounts system defines three separate sectors (Monetary financial institutions, Other financial intermediaries and Insurance corporations). Because of the creditor-debtor relationship of financial assets and external financing, each creditor sector has a counterpart debtor sector.

The primary function of economic entities in the sector Non-financial corporations (S.11) is to produce (real) goods and services for the market. Consequently, their task is to identify and invest in economically advantageous projects. The sector of Non-financial corporations includes genuine corporations (public limited companies, private limited companies etc) and quasi-corporations (chiefly partnerships, ie general partnerships and limited partnerships).

*Non-financial corporations (S.11)*

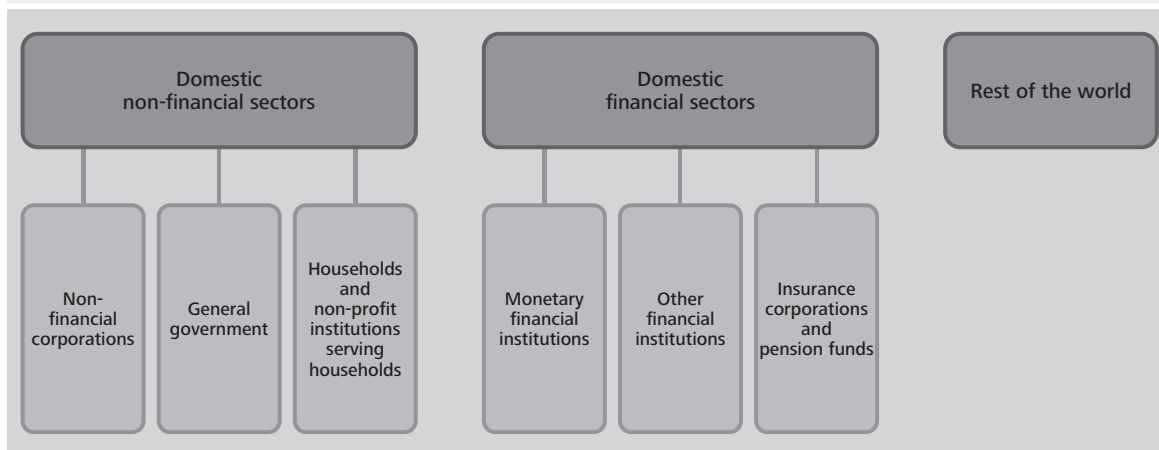

By contrast, the main task of the economic entities in the sector of Financial corporations (S.12) is to provide financial services. This sector is disaggregated into monetary financial institutions (MFI), other financial intermediaries (OFI) including financial auxiliaries, insurance corporations, and pension providers. The Bundesbank is included in the MFI sub-sector as a central bank, along with commercial banks, building and loans associations and money market funds, which are included as other MFI. In this sub-sector, money is created through lending and the collection of deposits from non-money-creating economic entities (households, non-financial corporations etc). The OFI sub-sector encompasses financial institutions that do not create money and do not provide insurance services (eg securities dealers, investment funds, financial vehicle corporations). Insurance corporations whose main focus is the assumption of risk relating to payment claims and the for-

*Financial corporations (S.12)*

<sup>6</sup> Concerning the compilation of integrated balance sheets for financial and non-financial assets see in detail Deutsche Bundesbank, Integrated sectoral and overall balance sheets for Germany, Monthly Report, January 2008, pp 31-45. For results for 1992 to 2010 see Deutsche Bundesbank and Statistisches Bundesamt, Sectoral and Macroeconomic Balance Sheets, 2010.

## Sectors of financial accounts

Deutsche Bundesbank

mation of insurance technical reserves, together with pension providers (supplementary pension funds for government employees, occupational pension schemes etc) form a sub-sector of their own.

*General government (S.13)*

The primary focus of sector General government (S.13) is the fulfilment of sovereign tasks in line with the principles of republic, democracy and constitutional, social and federal government. It comprises the subsectors local and regional authorities (federal, state, local) and social security funds. General government's main source of financing is compulsory payments (taxes, fees and contributions) and borrowing via financial markets. The supplementary pension funds for public-sector employees fall within the scope of the (private) insurance sector.

*Households and non-profit institutions serving households (S.14/15)*

The sector Households (S.14) includes all persons or groups of persons who are characterised primarily by the consumption of real and financial goods and services. It also includes (since ESA 95) persons or groups of persons who produce market goods and/or services, insofar as no quasi-corporations were formed for this purpose.<sup>8</sup> Consequently, sole proprietors, independent professionals, self-employed farmers etc also belong to this sector. Households are often grouped with non-profit institutions serving households (S.15) for statistical purposes. Pursuant to ESA 95, these are institutions which constitute separate legal entities, which serve households and which are private other non-market producers. These include, for instance, political parties, trade unions and churches.

*Rest of the world (S.2)*

Residents' assets and liabilities vis-à-vis non-residents are offset in the sector Rest of the world (S.2). Only the basic financial relationships and correlations with non-residents

are shown. Non-residents are not divided into principal macroeconomic sectors such as households, financial sector etc. Moreover, only those asset positions arising from links between residents and non-residents are shown in this sector. The total asset and liability position of non-residents can only be determined based on the results of all foreign financial accounts.

### Recording of financial instruments

Within the sectors, economic entities are structured according to their primary economic operations. These (financial) operations are, in turn, broken down according to various instruments. By analysing activities, conclusions can be drawn regarding the objectives of entities within the sectors. The instruments are therefore structured according to their liquidity (tradability), maturity and legal characteristics (see classification of instruments). Owing to the creditor-debtor relationship, creditor and debtor positions exist for each instrument. In the financial accounts, the definitions of financial instruments are independent of the creditor or debtor sectors involved.<sup>9</sup> Therefore, the dif-

*Instruments used for financial transactions (F)*

<sup>8</sup> This group of persons, which, prior to ESA 95, were still classified under Non-financial corporations, were re-classified to the sector Households mainly because it was felt that the relevant entrepreneurial activities were not being recorded adequately for statistical purposes and that they would be better reflected under other private lifestyles. For more detailed information, see Deutsche Bundesbank, Overall financial flows in 1999, Monthly Report, June 2000.

<sup>9</sup> The breakdown by maturity is based on the life or the period of notice originally agreed. Claims or liabilities payable on demand or with maturities of up to one year are normally classified as short-term, while those with longer maturities are deemed to be long-term.

ferent categories of deposits also include the balances of domestic sectors with foreign banks. Similarly, the item Loans comprises not only loans granted by banks and building and loan associations, but also unsecuritised lending by other sectors (eg mortgages and other loans granted by insurance corporations or general government).

*Monetary gold and special drawing rights (F.1)*

Monetary gold (financial gold, F.1) is gold held by central banks. It is part of the country's international reserves. Special drawing rights (SDR) are currency units defined and maintained by the International Monetary Fund (IMF), which are covered by the most commonly used international currencies. They are used as a means of settlement between central banks and international institutions.

*Currency and deposits (F.2)*

Currency comprises the banknotes and coins issued by the central bank. Generally speaking, currency is a liability of the institutional sector that issues it. As a modern form of debt money, banknotes are a liability of the central bank. By contrast, coins are a government liability in many countries, including Germany, due to the "coin prerogative". Deposits are deposits at MFI, which are either directly available (transferable deposits) or available after a variable or fixed term (other deposits). Currency and transferable deposits are used mainly as payment instruments for real economic or financial transactions, ie as direct payment methods. Short-term savings and time deposits, by contrast, are chiefly used for savings and are considered potential means of payment given their "near-money" status.

*Securities other than shares (F.3)*

Securities are securitised assets that can be traded on the market. This category of instrument includes only Securities other than shares (F.3), in other words, securitised borrowed capital. These are divided into money market papers and long-term debt securities and financial derivatives. Financing with an original maturity of up to one year is deemed short-term, whereas financing with an original maturity of more than one year is deemed long-term. Financial derivatives are financial instruments based on or derived from another instrument which allow special risks to be traded separately from the underlying instrument. Their value is determined using an underlying instrument, which can either be another financial asset (eg options on securities), an index (eg DAX futures), a commodity (eg commodity futures) or an event (eg credit default swaps).

*Loans (F.4)*

Loans (F.4) are unsecuritised assets which, unlike securities, are not directly tradable. Based on their original maturity they are divided according to short-term (maturity of up to one year) and long-term loans.

*Shares (F.5)*

Shares (F.5) comprise ownership rights in corporations. This capital generally enables the owner to influence cor-

porate decisions. Shares first and foremost includes direct holdings of shares, irrespective of whether or not they are listed. It also includes shares in other corporations (private limited companies and cooperative societies) and in partnerships. Substantial capital is tied up in such companies in line with the corporate structure in Germany. Mutual fund shares – ie shares in collective fund assets issued by investment funds – are also included in this category.

Insurance technical reserves (F.6) encompass claims arising in connection with possible future events. These usually relate to insurance corporations and pension providers as debtors. However, in the case of employers' pension commitments in connection with company pension schemes, the liability remains in the relevant debtor sector, eg Non-financial corporations. Contributions to social security funds (state pensions) are not included.

*Insurance technical reserves (F.6)*

The item Other accounts receivable/payable comprises claims and liabilities that tend to be the counterparts of other business activities, eg early or late payments for goods and services. This item includes enterprises' trade credits and prepayments/accrued income as well as government tax claims and payment arrears. With respect to the sector Households, other accounts receivable also include accumulated interest-bearing surplus shares with insurance corporations.

*Other claims/other liabilities (F.7)*

## Covering the dynamics

The financial instruments which are held and issued by the sectors are measured over time periods and at specific points in time. Flows (transactions) encompass the issue, exchange, transfer or utilisation of financial assets or liabil-

*Stocks and flows*

ities over a period of time, whereas stocks reflect these values at a particular point in time. As a rule, financial transactions and their counterpart entries are recorded at the same time.

*Reporting periods and frequency*

The financial accounts document the financial stocks and flows of the various sectors on a quarterly basis. The data are published quarterly, with this Special Statistical Publication produced once a year. The time lag between data being current and it being collated is at present about 4 months.

### Conceptual aspects

*Consolidation*

Economic entities may interact with entities within the same sector or with those from other sectors and thus carry out financial transactions. The unconsolidated approach takes into account transactions which take place within one sector. This reflects the overall activity of the sector. Under the consolidated approach, the financial relationships within a particular sector are offset against each other to produce consolidated data. This approach illustrates the external relationships of a particular sector with other sectors. The difference between the unconsolidated and consolidated accounts is attributable to the internal relationships and activity. This enables a more detailed analysis of the functions and links between financing and the acquisition of assets, particularly within the heavily disaggregated financial sector. Unconsolidated data for the individual sectors are published in the Special Statistical Publication to give a complete picture of external financing. However, the data in the matrices from page 50 onwards are consolidated and therefore illustrate the external relationships of the individual sectors.

*Valuation of flows ...*

The financial accounts aim to reflect transaction values at market prices, as these contain implicit information on the subjective valuation of stakeholders. Financial flows are therefore valued at actual transaction prices. In practice, this principle is often difficult to apply in cases in which stocks are to be shown at market prices rather than at their nominal value. It is most feasible to apply the transaction value principle wherever turnover statistics are available, for instance in the case of issuance of securities at issue prices. If, however, the figures on the transactions are derived from stock data which include revaluations, the aspired valuation concept can only be applied if changes in the valuation over time can be eliminated.

*... and of stocks*

The predominant criterion for valuing stocks is also market prices (or at least estimated market-related prices). In the case of financial operations in the form of securitised creditor or debtor relationships (or equity) and in foreign cur-

rency, daily market prices quoted in the securities and foreign exchange markets are used. In the case of unsecured claims and liabilities in domestic currency, however, these largely correspond to nominal values.

The use of criteria other than the nominal value for valuing financial flows and stocks leads to flow-stock discrepancies which, in the case of securities and foreign positions, may be significant. In such cases a seamless match between the recorded financial transactions and the changes in the stocks can only be achieved via an additional reconciliation account showing the audit trail between the initial position, transactions, valuation changes and the final position.<sup>10</sup>

*Valuation-related differences*

Financial flows are shown net in the German financial accounts, ie the increases in claims (or liabilities) of a specific type are offset against the relevant decreases in the period concerned. This representational concept is in line with the ESA 95, but also arises inevitably from the fact that stock statistics frequently have to be used in order to derive the financial flows.

*Net recording*

The system of double-entry bookkeeping in the financial accounts results from creditor-debtor relationships. All assets are therefore matched by counterpart liabilities, broken down by instrument and sector and sub-divided according to transactions and stocks. The monetary assets of one party are the monetary liabilities of another. This requires consistency of data. The totals of the relevant balance sheet positions for instruments and sectors must match. This consistency applies to both the result of the financial accounts and the sources and procedures used.

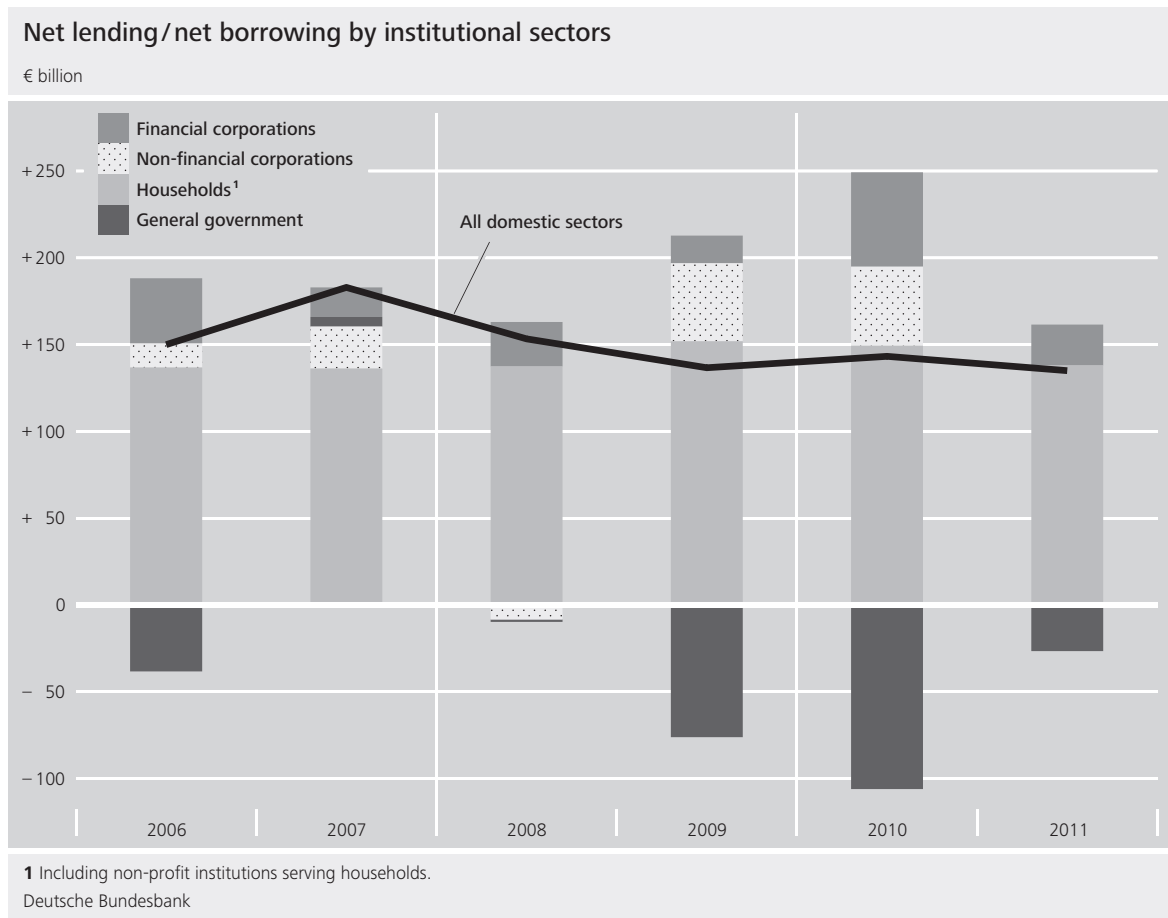

*Consistency*

### Statistical sources

Worldwide, there are hardly any separate collections of statistics for the specific purposes of the financial accounts. As a consequence, existing statistical information which primarily serves other purposes always has to be used in compiling them. A case in point are the banking statistics, which are collected by central banks primarily in connection with performing their monetary policy and prudential supervisory functions. The same applies to securities statistics for analysing the capital market and to various statistics for compiling the balance of payments. The financial accounts therefore assume the character of

*Financial accounts as secondary statistics*

<sup>10</sup> Discrepancies between flows and stock variables can also arise, moreover, as a result of reclassifications within a sector at the instrument level or a change in the allocation of individual units to an institutional sector. However, such reclassifications occur only irregularly and are usually minor.

secondary statistics which are based on statistical components from diverse financial areas which are linked consistently with one another.

Germany, for example. If there are no well-founded points of reference, as with domestic transactions of financial derivatives, no explicit record is made or information shown.

*Indirect information*

The information for compiling the financial accounts can be obtained either directly or indirectly. In the first case, the data stem directly from the institution for which they are needed, in other words, from households or enterprises themselves. The second option is to obtain the desired data indirectly – ie from other sources, for example credit institutions or other financial intermediaries. Both methods have advantages and drawbacks. The direct method is often impeded in practice by considerable psychological resistance, legal hurdles and high costs. On the other hand, the indirect method used in Germany has the advantage that one can draw on existing statistics which, on account of legal regulations, are usually sufficiently detailed, comparatively dependable and available without a too great time lag. The disadvantage of this method is that these statistics do not necessarily meet the specific requirements of the ESA. In such cases, statistical procedures and adequate additional information are used in an attempt to fill the gaps. Because the resulting statistics are estimates, the results should be interpreted with caution, however, as is the case with the position Other equity in

The most important sources for the financial accounts are the statistics of financial intermediaries, particularly the monthly banking statistics and the quarterly data on the financial position of insurance corporations. The bulk of the stock data come from these sources, which sometimes also indicate the sectors in which the claims shown are concurrently incurred as liabilities and, conversely, the liabilities accrue as claims. Further data are provided, for example, by the capital market statistics and the securities holdings statistics, the balance of payments statistics, the international investment position, corporate balance sheet statistics and various government financial statistics.

*Main sources*

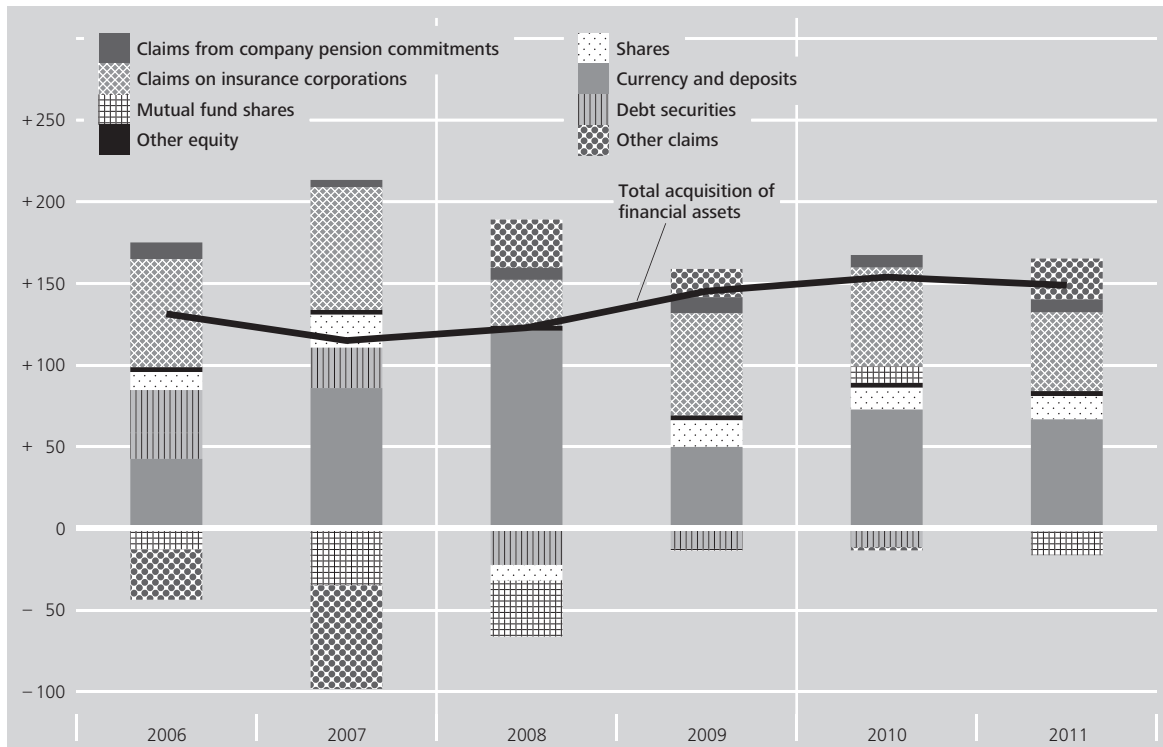

### Compilation

The financial accounts statistics are generally compiled according to the bottom-up principle, ie data for the top sector are calculated using available data for the sub-sectors and sub-categories of financial instruments. Where this is not possible owing to incomplete sub-account data, data from higher accounts are disaggregated for the

*Financial accounts process*

### Acquisition of financial assets by households\*

€ billion

\* Including non-profit institutions serving households.  
 Deutsche Bundesbank

lower accounts according to the top-down principle. In the compilation process, transactions are calculated first, then stocks. Owing to the varying degrees of reliability and temporal availability of primary statistics, data are compiled according to a hierarchy of sources for the selection of data sources to calculate the various instruments and sectors. These are based on the objective of capturing, above all, the domestic sectors accurately. Discrepancies that exist between individual data sources owing to the use of different methods in collecting data are compensated in part via the foreign account. At the same time, the consistency of instruments (horizontal consistency) and sectors (vertical consistency) is checked and ensured. In the case of vertical consistency, the consistency of the real-economic national accounts and financial accounts (sectoral balances) is verified.

#### Revisions

The results of the financial accounts are revised from time to time. Such adjustments, which are also implemented retroactively, are essentially made for any of three reasons. First, changes in the data of the primary statistics used are taken into consideration in this way. Revisions of this kind can become necessary due to changes in the source classification, definitions or changes in the classification of economic entities. Second, as the availability of suitable

primary statistics changes over time, the additional inclusion of new or the replacement of previous data leads to revisions of the financial accounts. It is necessary to take such changes in the primary statistics into consideration in the financial accounts to ensure the consistency, up-to-dateness and high quality of the data and of the information contained therein. Third, methodological changes in the financial accounts themselves – such as the conversion to the updated ESA 2010 planned for 2014 – necessitate revisions. The financial accounts are based on primary statistics. Any change in the source data therefore necessitates a retroactive change in the financial accounts data (revision). Such revisions may be caused by changes in the source classification or changes in the classification of economic entities. They are necessary to ensure the consistency and reliability of data and the information contained therein.

### Selected developments over the years 2006 to 2011

The chart above shows net lending/net borrowing for the period from 2006 to 2011. It shows consistently high net lending for households, in particular. Such developments

*Net lending of households ...*

are frequently observed in highly developed economies. Net lending is regularly recorded in this sector in other euro-area countries, too. In Germany, this was due, among other things, to a relatively subdued development of private consumption, which did not grow as quickly as available income in the period under observation as a whole. Some of the resulting growth in savings was used to finance net investments (mostly construction investment) and therefore formed an important basis for high net lending.

... and corporations

A similar, albeit less pronounced, development was observed for corporations. While the financial sector typically provides more funds than it borrows the net lending position by non-financial corporations is relatively unusual. Once again, this is partly due to dynamic income development: corporate profits according to national account data were, with the exception of the crisis year 2009, consistently higher over the entire period under observation than in all the years before. It was therefore possible to finance net investment largely by own funds which, except for the years 2008 and 2011, did not develop as favourably as corporate savings, thus boosting net lending.

General government and the rest of the world benefited from the behaviour exhibited by the domestic private sectors. With the exception of 2007, government consistently recorded net borrowing according to the national accounts due to, among other things, measures to stabilise the financial sector and economic stimuli during the crisis-induced recession. When these measures were phased out and real growth increased it was possible to reduce the deficit considerably in 2011. The remaining (high) domestic savings surplus over the period observed flowed abroad and was reflected in comparatively high positive current account balances according to the national accounts.

*Net borrowing of the general government and the rest of the world*

The savings (including net capital transfers received) in excess of net investment (including net acquisitions of non-produced non-financial assets) were invested by households in different ways. The chart on page 12 shows the structure of the acquisition of financial assets by households in the period from 2006 to 2011. While investment at banks and insurance corporations traditionally played a significant role, comparatively little was invested in listed financial instruments such as shares and fixed-income securities over most of the period. This behaviour was particularly marked in 2008, when stock prices fell

*Banks and insurance corporations important for households*

dramatically on the capital markets as the financial crisis intensified. Market-based forms of finance therefore became significantly less attractive and were sold in large quantities. The freed-up funds were invested primarily in liquid bank deposits, but a significant volume was also held temporarily as cash. As the capital markets stabilised and the economy recovered, investment behaviour returned to normal over the course of 2009. Insurance corporations ultimately benefited, among other things, from one-off payments similar to an attractively remunerated fixed-term deposit.

*External financing of non-financial corporations dynamic*

By contrast, the external financing of non-financial corporations between 2006 and 2011 developed comparatively positively, as shown in the chart on page 13. While external financing initially rose significantly in the years of the economic upswing – 2006 and, above all, 2007 – compared with the previous years, it receded again in 2008 and 2009 due to the crisis. As economic activity recovered, external financing, too, stabilised in 2010 and picked up again perceptibly with a slight time lag in 2011. Credit was

the most important component in the period under observation. Aside from banks, other financial intermediaries and insurance corporations also acted as lenders. In 2009, when banks were being more conservative in their lending as a result of crisis-related pressure, more and more other non-financial corporations (for example, in internal group financing) from both Germany and abroad stepped in as lenders, thus preventing major financing bottlenecks.<sup>11</sup> Trade credits have also become increasingly important in recent years. Conversely, market-based financing played no significant role over the entire period, as neither shares nor bonds were issued in significant quantities in Germany. Whereas, in the euro area, (bank) loans were substituted by market-based financing as a result of the financial crisis, changes in the structure of the lenders were observed more in Germany.
