

## The Foreign Sector in the U.S. Flow of Funds Accounts

John F. Wilson\*

Questions arise frequently about the relation between the Foreign Sector shown in the U.S. Flow of Funds Accounts (FFA) and the U.S. Balance of Payments (BPA) statistics. Even casual inspection shows that there are sharp differences in detailed data entries, although broader figures such as the U.S. current account balance and the statistical discrepancy are much the same. This paper gives a description of the way the FFA Foreign Sector works and how it relates to the BPA statistics. It includes several illustrative tables and detailed line descriptions of the data sources currently used to assemble this sector of the accounts. The paper deals with statistical reconciliations; it does not present research results.

On the following page is a sample of the published Foreign Sector table--which in the FFA release is on the same page as State and Local Governments.<sup>1/</sup> The top portion shows U.S. current account components, ending with the balance, shown with sign reversed on line 8 as the "Foreign Current Account Balance". The foreign capital account balance corresponding to this result is shown on line 9, and lines 10 and 27 show the net changes in foreign assets and liabilities, respectively, which produce the results on line 9. The difference between lines 8 and 9 is the statistical discrepancy, which is at line 48 in the table. None of the mentioned lines match

---

\*/ Senior economist, Flow of Funds Section, Board of Governors of the Federal Reserve System. I wish to thank my colleagues, Judi Ziobro, Susan McIntosh and Kip Thoresen for providing the data which made this note possible. Special appreciation goes to Steve Taylor, not only for data assistance, but also for helpful comments on several drafts of this paper, and to Dale Henderson and to Walther Lederer for additional comments. Becky Hughes kindly transformed another of my midnight inspirations into intelligible typescript and cheerfully indulged the necessary changes. This paper represents the views of the author and should not be interpreted as reflecting the views of the Board of Governors of the Federal Reserve System or other members of its staff.

<sup>1/</sup> See Flow of Funds Accounts, Federal Reserve Board Release Z.1 (Quarterly), pp. 12-13.

<sup>1</sup> Includes reinvested earnings of incorporated affiliates.

<sup>2</sup> Beginning in 1960, the treatment of net exports of gold in the NIPA's differs from that in the BPA's. BPA gold exports (line 2) and imports (line 9) are removed from the NIPA's. Imports of gold in the NIPA's (line 13) is the excess of the value of gold in domestic final sales plus the change in business inventories over the value of U.S. production of gold. Prior to 1960, the treatment of net exports of gold in the NIPA's and BPA's is identical, and is the same as the present NIPA treatment.

<sup>3</sup> BPA capital gains and losses included in U.S. direct investment income abroad (line 3) and in foreign direct investment income in the U.S. (line 10) are removed from the NIPA's beginning in 1978; data needed to remove them from the NIPA's in earlier years are not available.

<sup>4</sup> Consists of statistical revisions in the BPA's that have not yet been incorporated in the NIPA's.

<sup>5</sup> Consists of arms shipments to Israel financed under the Emergency Security Act of 1973 and subsequent legislation. In the NIPA's, these arms shipments are classified as military grants, which are included in the defense purchases component of GNP when they are acquired by the U.S. Government. Their transfer abroad is not reflected in the NIPA's.

<sup>6</sup> Represents interest paid by government to foreigners. This item is treated as an import of services in the BPA's. In the NIPA's, it is excluded from government purchases and, thus, also from imports.

<sup>7</sup> Consists of a U.S. Government payment to India under the Agricultural Trade Development and Assistance Act. In the NIPA's, this payment is included in capital grants received by the United States (net). In the BPA's, it is included in unilateral transfers (excluding military grants of goods and services), net.

<sup>8</sup> Consists of financing provided to Israel in accordance with the Emergency Security Act of 1973 and subsequent legislation.

"corresponding" lines in the Balance of Payments Accounts, as presented in the Survey of Current Business (e.g., Tables 1-2 "U.S. International Transactions", attached).

A principal reason for the difference between FFA and BPA current accounts is that the FFA version is taken directly from the National Income and Product Accounts (NIPA Table 4.1, attached) rather than from the balance of payments statistics.<sup>2/</sup> NIPA makes certain adjustments to both exports and imports of goods and services as measured on the BPA basis. These adjustments mainly concern gold, capital gains in direct investment income and (on the imports side) payment of income on U.S. government liabilities. A reconciliation of the BPA and the NIPA is published in the annual revision tables for NIPA, usually in the July SCB as Table 4.5; the one which appeared in July 1983 also is attached for reference.

As can be seen from these materials line 8, labelled "current account" in the published FFA table, is the same as net foreign investment in the NIPA for 1982. However, in 1981 there is a difference of \$1.1 billion between the FFA "current account" and NIPA net foreign investment. This is because "capital grants received by the United States"--SDR allocations--which are recorded on the receipts side of the NIPA foreign transactions accounts, are excluded from the FFA flow statistics. The FFA figures on line 8 thus are lower than the NIPA counterpart by the amount of SDR allocations in years when these are made. This difference is offset in line 11 of the table, which also excludes SDR allocations to the U.S., allocations that are in BPA Table 1, line 40, so this doesn't affect the

---

<sup>2/</sup> NIPA is the basis for all nonfinancial activity in the FFA.

statistical discrepancy. The difference in discrepancy is thus the net effect of all items in NIPA Table 4.5 other than SDR allocations. The table below illustrates this reconciliation more completely.

1982 and 1981 "Current Accounts" and Discrepancies  
(\$ Billions)

	<u>1982</u>	<u>1981</u>
BPA Current Account (T.1-2, line 79)	\$-11.2	4.6
- NIPA Net Foreign Investment (T.4.1)	-8.3	4.0
+ SDR allocations (T.1-2, line 74)	\$ 0	<u>1.1</u>
= Difference	\$ -2.9	1.7
FFA Foreign Sector Discrepancy (line 48)	\$ 38.5	25.9
- BPA Statistical Discrepancy (T.1-2, line 75)	<u>41.4</u>	<u>24.2</u>
= Difference	\$ -2.9	1.7

With the difference in discrepancies fully explained by the current account definitions, the table implies that net capital flows in the BPA and FFA are equal. This is in fact the case, although as the next table illustrates, totals of "inflows" and "outflows" can be quite different.

1982 Measured Capital Flows: BPA and FFA  
(\$ Billions)

BPA

Foreign Assets in U.S., net (T.1-2, line 56)	\$ 87.9
plus: U.S. Assets Abroad, net (T.1-2, line 37)	<u>-118.0</u>
= Net (- = outflow from U.S.)	- 30.1

FFA

Net Acquisition of Financial Assets (line 10)	\$ 1.5
less: Net Increase in liabilities (line 27)	<u>31.7</u>
= Net (- = outflow from U.S.)	\$ -30.2

Obviously, the arithmetic of the measured-capital-flow portion of the Flow-of-Funds Accounts reproduces the same net results as the BPA, even though the FFA versions of particular inflows and outflows differ from the BPA and--as is known or at least suspected by many readers--a variety of

non-BPA sources are used to assemble the FFA series. The objective of the remainder of this paper is to give some detail on how these line items reconcile to the BPA.

Two problems confront many readers who compare the FFA version of the capital account to the BPA version. One is that, while BPA sources are relatively well known and understood, FFA sources are not. The other is that the published FFA Foreign Sector table is much less detailed than the BPA equivalent, and also it does not show most of the underlying "arithmetic" which generates the line item results. An understanding of this background detail is important to explaining how the sector works.

I have attempted to surmount these problems by preparing a much more detailed version of the FFA Foreign Sector table than appears in the Z.1 publication. This expanded version of the table is attached for reference at the end of this note.<sup>3/</sup> The major contrast to the published form is that the expanded table shows all of the input items to calculations in the Foreign Sector and gives a clearer picture of the order of calculation. By "inputs" in FFA is meant those data which are gathered from published or unpublished sources, and consequently are not created by the FFA arithmetic. Of the line items shown in the published version of the FFA foreign sector, only a few are inputs; most are outputs. The expanded table shows it all. In the body of the expanded table, along with specimen annual data for 1981 and 1982,<sup>4/</sup> there are also shown the FFA codes assigned

---

<sup>3/</sup> At this writing 1983 data have also been published in the FFA, but for the Foreign Sector QIV still is partly (educated) guesswork, so the 1983 annual figures are omitted.

<sup>4/</sup> Owing to limitations in the FFA programs on the number of lines which can be put in one table, the expanded Foreign table has been split into two parts. The first follows the published version down through changes in foreign assets. The second covers changes in foreign liabilities and the statistical discrepancy.

to each line item. These may be of little interest to most readers, but may be relevant to those who are regular users of the flow of funds statistics.

Following the expanded table are some of pages of detailed source information, keyed to the table's line numbers. Because all the inputs to the foreign sector appear somewhere in the table, and are thus associated with a source, this and the indicated arithmetic give a comprehensive description of how the sector is added together. My objective in writing down data sources has been to provide a sufficiently detailed description, in terms of publications, tables and line-references (or in terms of worksheet calculations) so that any user can track down the exact input. Of course, data sources or data locations within existing sources sometimes change. Hopefully, the appended descriptions will be sufficient to survive a few revisions of governmental data presentation.

In this text I do not propose to discuss all the details of the Foreign Sector arithmetic. These are largely self-evident in the expanded table itself and the highlights of BPA/FFA reconciliation are given in the Summary found on page 10. However, four comments are in order here.

First, as the notes to the table show, data for the FFA Foreign Sector are gathered from a number of sources. These include the BPA themselves. They also include sources of information which go which may not appear as separate items in the SCB's BPA tables. Additionally, Federal Reserve material and data from a few nongovernmental sources (e.g., the

Investment Company Institute) also are used as inputs to these accounts. Probably the most important non-BPA body of information concerns the banking data on both sides of the Foreign Sector. Banking figures are exclusively derived from the Federal Reserve call reports and other banking statistics.

A second comment concerns the asset/liability split in the FFA Foreign Sector. Casual inspection of the published table might suggest that changes in foreign assets and foreign liabilities are clearly separated, as they are in the BPA.<sup>5/</sup> However, line 14 in the published table, "Net Interbank Claims," really is a net figure which mainly balances out due-tos and due-froms of both domestically-chartered and foreign-related banks. This fact is made clear in lines 22-29 of the expanded table, which provide the entire decomposition. Also included under the "net interbank" rubric are deposits in foreign banks and loans by foreign branches of U.S. banks to domestic nonbanks. All this means there is some partial netting of "domestic" and "foreign" assets and liabilities on the assets side of the Foreign Sector, and this is the principal reason for the BPA/FFA differences in capital flow data shown in the second text table above. Additionally, U.S. net purchases of gold and SDRs are shown as foreign net buying, with sign reversed. This is because these assets have no counterpart liabilities. With these exceptions "domestic" and "foreign" assets are separated in the FFA, as they are in the BPA.

Third, there are certain definitional differences. In the BPA, net Eurobond issues by Netherlands Antilles affiliates of U.S. firms (the proceeds of which are loaned to the parent companies) are treated as negative direct

---

<sup>5/</sup> Note that the capital flow section of the FFA Foreign Sector is written from the "foreign perspective". An increase in liabilities thus has a positive sign, even though it represents a capital outflow in the BPA.

investment by the U.S. parents. In the FFA these bonds are added back into foreign acquisitions of U.S. corporate bonds, and a corresponding amount is put back into the BPA version of U.S. direct investment. Also, in the BPA IBFs are treated as part of the domestic economy; in FFA IBFs are treated as foreign. More on this is found below in the section on banking data.

Fourth, on both the asset and liability sides of the Foreign Sector, BPA inputs are used in such a way that total asset and liability changes (except for the netting and shifting described above) come out the same as in the BPA. Note that under "Miscellaneous-Other" (line 49 in Part 1 of the table and line 40 in the second part), the arithmetic deriving the "Other" amount commences with BPA data on foreign private assets in the U.S. and U.S. private assets abroad, respectively. The code list subtracted from this total consists of all the input or computed private transactions which figure elsewhere in the table. This means that on both sides of the account, "Other" captures differences between BPA definitions and measurements of line items and those in the FFA presentation, as well as items not specifically measured in other lines of the table. The order of arithmetic is such that "Net Assets" (line 15 in Part 1) and "Net Liabilities" (line 1 in Part 2) are added up from all the indented detail, including "Other". So except for the interbank netting mentioned above and the different treatment of direct investment in the NIPA and BPA, the aggregated totals come out the same in the BPA and FFA presentations. At levels of line-item detail, therefore, there may be no exact match between these alternative versions of the foreign sector, but the FFA arithmetic restores the correspondence at the level of total assets and liabilities.

Banking Data

FFA treatment of U.S. external accounts differs from the BPA and TIC data collection in regarding international banking facilities (IBFs) as part of the "rest-of-world". This treatment is in line with most Federal Reserve presentations of banking statistics and is analytically consistent with the principal asset/liability restrictions imposed on IBFs since their inception in December 1981. One of the problems in preparing the banking figures, therefore, is to separate data on domestic and foreign-related banks from associated data on their affiliated IBFs. In the line-notes to the expanded table the source of banking figures is given simply as "call reports". The balance of this text will sketch the background computations on these data before they are introduced into the Net Interbank section on the assets side of the Foreign Sector and the Bank Loans n.e.c. section of the liabilities side.

Two principal characteristics of recent call reports are relevant. First, call report statistics on domestically chartered and foreign-related banks include IBFs through 1983, and IBFs are treated as foreign in FFA.<sup>6/</sup> Hence, IBF effects must be removed. Second, individual banks report their "due tos" and "due froms" on a net basis, whereas in the FFA these figures are needed on a gross basis to be consistent with BPA.

The worksheet treatment of data on foreign-related banks is simpler than for domestically-chartered. Using available detail in the call reports, gross positions of foreign-related institutions vis-a-vis "foreign affiliates" are adjusted to remove IBF components, which appear in a separate call report form. This leaves clean data on foreign-related gross positions with affiliates (parent banks and others) geographically located in foreign areas.

<sup>6/</sup> Starting with March 1984, there is a domestic call-report excluding IBFs.

For domestic banks the procedure is more roundabout, because the domestic call doesn't show gross due-tos and due-froms at all. Totalling positions of banks in net due-to and those in net due-from status separately and netting these results gives a combined "net" figure for the whole system that, again, includes IBFs.<sup>7/</sup>

At this point data from FR. 2502 (old form FR. 502) are used to get the gross due-tos of domestically-chartered banks to foreign affiliates. The net figure described above then enables the calculation of gross due-froms. Next, IBF components are removed by subtracting IBF positions vis-a-vis foreign affiliates, as taken from the Federal Reserve IBF call reports. Finally, net claims of U.S. banks on IBFs are added to their gross due-from position.

The effect of this calculation is to remove completely from the FFA statistics IBF transactions with affiliates in foreign countries and to shift the IBF position into a single foreign net amount due to the domestic parent. In FFA statistics, therefore, IBFs are treated as if they were foreign branches and as part of the foreign sector.

Similar treatment is applied to other banking data which appear in the Foreign Sector. Background IBF adjustments are also made for bank balances in foreign banks (lines 25 and 28 on the assets side) and for bank loans to foreign official institutions, foreign banks and to "other foreign" in lines 12-21 on the liabilities side.

---

<sup>7/</sup> As the call reports are somewhat delayed compared to the preparation of the flow of funds statistics, TIC information is used to carry forward these net figures for the most recent period.

Relation of FF Foreign Sector to  
Balance of Payments Accounts:  
Summary

- 1) FF current account is taken from NIPA rather than BPA, and conceptual differences are carried through to difference in statistical discrepancies between FF and BPA.
- 2) FF capital account is statistically locked to BPA totals of outflows and inflows, but
- 3) Some items in FF are taken from U.S. domestic banking statistics rather than from TIC, and
- 4) Foreign buying of Treasury securities is taken from broader Treasury compilation than in TIC.
- 5) These FFA differences in statistical source are buried, within BPA-based control totals, in unallocated residual asset and liability categories in foreign sector.
- 6) IBFs are treated in FFA as foreign, whereas in BPA they are domestic.
- 7) Allocations of SDRs to the U.S. are excluded from FF flows both in current account and capital account.
- 8) Netherlands Antilles bond issues are treated as foreign buying of U.S. bonds rather than as negative U.S. direct investment outflows.
- 9) Other items are shifted between outflow and inflow sides, with sign changes, to result in totals of outflows and inflows that appear different from BPA, even before creation of IBFs in 1981-82 caused substantive difference in totals.

## Notes to Foreign Sector Data Descriptions and Sources

The Foreign Sector is part of Table 45 in the standard Flow of Funds numbering system. It appears on pp. 12-13 of the quarterly Z.1 publication, Flow of Funds Accounts. The expanded table in this note has, for programming reasons, been split into two pieces.

Line numbers in the following descriptions refer to table lines in the two parts of the expanded Foreign Sector table.

### As to main source descriptions:

NIPA	= National Income and Product Accounts, in the <u>Survey of Current Business (SCB)</u>
BPA	= Balance of Payments Accounts, in <u>SCB</u>
FRB	= Federal Reserve <u>Bulletin</u>
Call Reports	= Federal Reserve bank call reports, published irregularly in <u>FRB</u>
TB	= <u>Treasury Bulletin</u>
MSPDUS	= <u>Monthly Statement of the Public Debt of the United States</u>
FRBNY	= Federal Reserve Bank of New York

### As to notation

Form of arithmetic in underlying FFA processing is indicated in the line item descriptions of the expanded table. "Input" data are not marked explicitly in the table, but all inputs have source descriptions in the line notes.

(R) on the expanded table denotes a value determined as a residual.

(-) in the source description means a sign reversal between data-source and flow of funds storage. Data values as stored appear in the body of the table.
